Exercise 1 Use the normalCopula() function from the copula package to create a two dimensional Gaussian copula with a parameter of 0.9. Then create another Gaussian copula of parameter 0.2 and look at the structure of both copulas. Exercise 2 Use the rCopula() function to generate two samples of 500 points which distribution is the copulas from exercise 1.

R-exercises - Introduction to copulas Exercises (Part-2)

Copulas are a powerful statistical tool commonly used in the finance sector to generate samples from a given multivariate joint distribution. The principal advantage of using those types of function over other methods is that copulas describe the multivariate joint distribution as his margin and the dependence structure between them,

Survival copulas are copulas too Ex. In dimension $d = 2$, show that $C(u;v) = u + v - 1 - C(1-u;1-v)$ Ex. Show that if C is the copula of $(X_1;:::;X_d)$, then C is the copula of $(X_1;:::;X_d)$, or more generally of $(T_1(X_1);:::;T_d(X_d))$ for decreasing functions T_j . Ex. If $(U;V) \sim C$, calculate the cdf's (copulas) of $(1-U;V)$ and $(U;1-V)$.

Copula - a definition Definition: Ad-dimensional copula is a distribution function on $[0,1]^d$ with standard uniform marginal distributions. . Example 1: $C(u,v)=uv$. If $U \sim U(0,1)$ and $V \sim U(0,1)$ are independent, then. $C(u,v)=uv=P(U \leq u)P(V \leq v)=P(U \leq u, V \leq v)=H(u,v)$, where $H(u,v)$ is the distribution function of (U,V) .
